Velocities and Twists

- The spatial velocity: $\widehat{V}_{ab}^{s}$
- The body velocity: $\widehat{V}_{ab}^{b}$
- Adjoint matrix: Ad_g such that

$$V_{ab}^{s} = \mathrm{Ad}_g V_{ab}^{b}$$

Linear Algebra and Adjoint Matrix

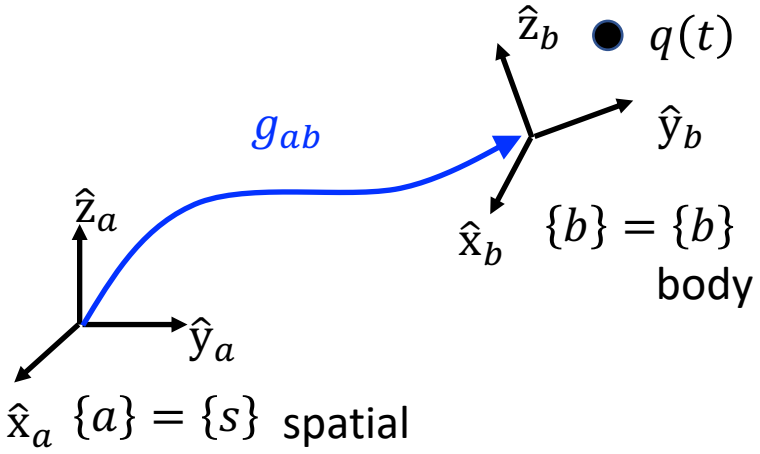
$$R(\omega_1 \times \omega_2) = (R\omega_1) \times (R\omega_2)$$

$$R\hat{\omega}R^T = (R\omega)^{\wedge}$$

$$g\hat{\xi}g^{-1} = \left(\mathrm{Ad}_g \xi\right)^{\wedge}$$

$$\mathrm{Ad}_g = \begin{bmatrix} R & \hat{p}R \\ 0 & R \end{bmatrix}$$

Velocities and Twist Motion



$q(t)$: moving point

$q_a(t)$: coordinate of the point w.r.t. $\{a\}$
$q_b(t)$: coordinate of the point w.r.t. $\{b\}$

$v_{q_a}(t)$: coordinate of the velocity of the point w.r.t. $\{a\}$
$v_{q_b}(t)$: coordinate of the velocity of the point w.r.t. $\{b\}$

Definition of the spatial velocity:

$$v_{q_a}(t) = \hat{V}^s_{ab} q_a(t)$$

In the book, we have $\hat{V}^s_{ab} = \dot{g}_{ab} g^{-1}_{ab}$.

Definition of the body velocity:

$$v_{q_b}(t) = \hat{V}^b_{ab} q_b(t)$$

In the book, we have $\hat{V}^b_{ab} = g^{-1}_{ab} \dot{g}_{ab}$.

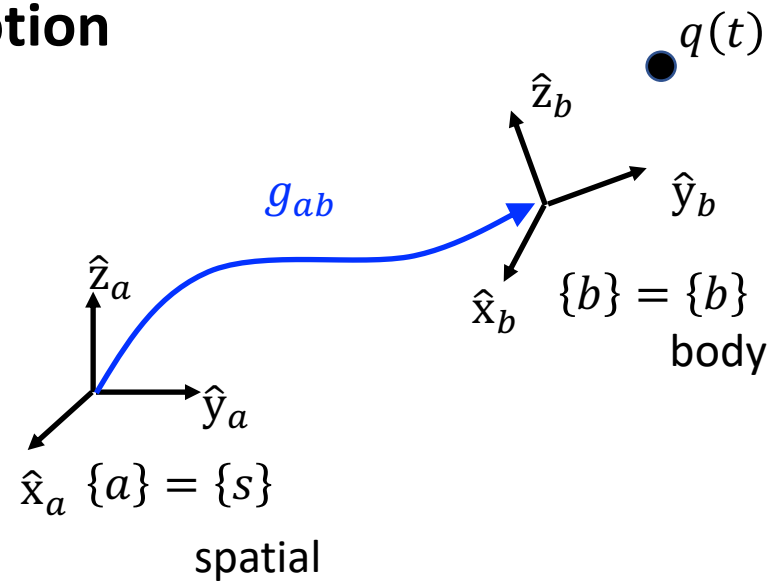
$$V^s_{ab} = \mathrm{Ad}_{g_{ab}} V^b_{ab}$$

Velocities and Twist Motion

Definition of the spatial velocity:

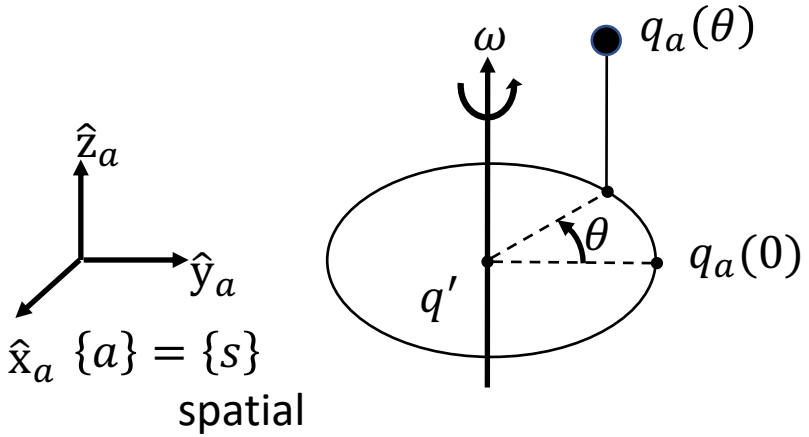
$$v_{q_a}(t) = \hat{V}^s_{ab} q_a(t)$$

EX. Constant twist motion between the two frames: $g_{ab} = e^{\hat{\xi}\theta(t)}$



[redacted]

Short Review: Screw Motion and Twist



q': the center of the rotation, or a point on the rotation axis.
ω: the direction of the rotation axis.

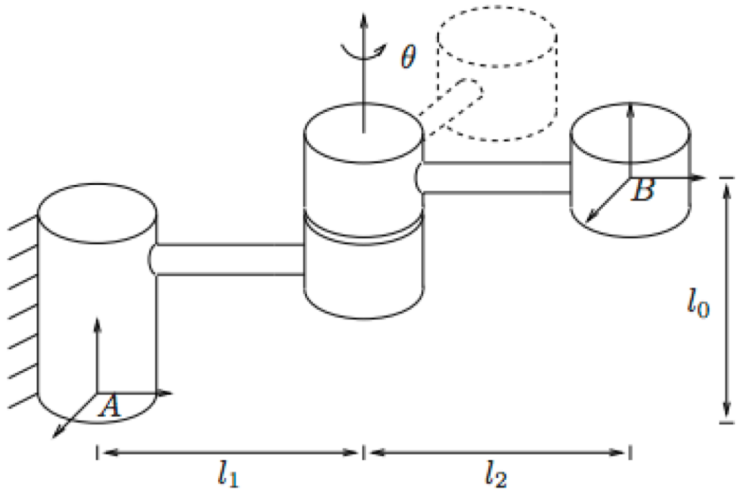
We can find the twist $\xi = [v, \omega]^T$ using the given q' and ω.

$$v = -\omega \times q' + h\omega$$

By the screw motion, we can find the spatial velocity V_{ab}^{s} using q' and ω.

Example: MLS example 2.5 in pg 56 - 57

Spatial velocity: find V_{ab}^{s}



Body velocity: find V_{ab}^{b}
